

Online Portfolio Template Generator - EverLeaf

1. PROJECT TITLE

Online Portfolio Template Generator - EverLeaf

2. PROJECT DESCRIPTION

EverLeaf is a web-based portfolio template generator that lets users enter and manage their professional information, choose from three portfolio templates, preview their portfolio, and publish a shareable page. Owners can keep a portfolio private or publish it, according to the application's available controls.

3. TECHNOLOGIES USED

A. Frontend Development Tools

Technology/Tool	Purpose
Next.js 16.3.8	Active web framework. Provides the App Router, pages, routes, and server features in next-app/.
React and React DOM 19.2.8	Active user-interface components and browser rendering.
TypeScript 5.9.3	Active typed application source and type checking.
Tailwind CSS 4.3.3 and custom CSS	Active styling for responsive layouts and the EverLeaf visual design.
HTML, CSS, and JavaScript	Markup, styling, and browser/runtime language technologies used by the application.
PostCSS with @tailwindcss/postcss 4.3.3	Active Tailwind CSS integration in the Next.js build.
Vite 7.3.6	Legacy Laravel asset and development tooling at the repository root; it does not build the Next.js application.

B. Backend Development Tools

Technology/Tool	Purpose
Next.js Server Actions 16.3.8	Active server-side application logic in the Next.js App Router.
Supabase Auth	Active authentication service integration in the Next.js application; remote project settings were not inspected.
Supabase Storage	Active image-storage integration for portfolio profile and project images; remote bucket settings were not inspected.
@supabase/ssr 0.12.7	Active browser/server client setup and cookie-based session support.
@supabase/supabase-js 2.117.2	Active client library for Supabase authentication, database APIs, and file storage.
Laravel 12.69.2 (Legacy)	Earlier Laravel/Blade implementation retained at the repository root; not the active Next.js application backend.
PHP ^8.2 (Legacy)	PHP requirement in the root Composer manifest for the earlier Laravel implementation; this does not establish an exact installed PHP version.

C. Database Development Tools

Technology/Tool	Purpose
Supabase-hosted PostgreSQL	Active database service used by the Next.js application. PostgreSQL server version and remote migration status were not independently checked.
SQL migrations and Row Level Security	Active schema and access-policy definitions stored in next-app/supabase/migrations/; remote application status is unverified.
SQLite (Legacy Laravel default)	The root .env.example and config/database.php use SQLite as the legacy Laravel example default; it is not used by the active Next.js/Supabase application.
MySQL (Legacy/local option)	The legacy Laravel configuration includes a MySQL connection. The project reports local use with XAMPP, but the checked-in .env.example defaults to SQLite and does not verify XAMPP use.

D. Storage Tools

Technology/Tool	Purpose
Supabase Storage - portfolio-media	Active application integration for profile and project images. Source migrations define the bucket and policies; remote bucket state was not inspected.
AWS S3-compatible storage	Optional capability in the legacy Laravel implementation through its Composer adapter and environment placeholders; not the active Next.js storage service.

E. General Development and Version Control Tools

Technology/Tool	Purpose
Node.js and npm	Used to install and run the Next.js app. The project does not pin exact versions; Next.js 16.3.8 requires Node.js 20.9.0 or newer.
Visual Studio Code	Project-reported development editor; not part of the deployed application.
Git and GitHub	Version control and source-code hosting for the nextjs-vercel branch.
Composer	Dependency manager for the earlier Laravel/PHP implementation; not needed to build the Next.js application.
XAMPP	Project-reported local-development tooling for MySQL/Laravel; not established by the repository configuration and not part of production hosting.
Docker	A root-level Dockerfile builds the earlier PHP/Laravel application and its Vite assets; it is not the Next.js/Vercel deployment configuration.

F. Deployment and Hosting Tools

Technology/Tool	Purpose
Vercel	Primary hosting platform associated with the published Next.js website. The project dashboard configuration was not independently inspected.
GitHub	Hosts the project source repository; it is not the application hosting platform.

Technology/Tool	Purpose
Render (Legacy/alternative)	A root render.yaml describes a Docker/Laravel service on the legacy master branch. This is an alternative/legacy configuration, not the active Next.js deployment.

4. DATABASE PLATFORM

Supabase is the managed backend platform used by the application. PostgreSQL is its relational database engine and stores portfolio records. Supabase Auth handles account sessions, while Supabase Storage is used for profile and project image files. Supabase is the database/backend provider; Vercel is the application hosting platform. The earlier Laravel configuration also offers MySQL, while its checked-in example defaults to SQLite; the project reports XAMPP for local MySQL development, but that use is not established by repository configuration.

5. HOSTING/DEPLOYMENT PLATFORM

Vercel is the hosting and deployment platform associated with the deployed Next.js application. The application directory in the repository is next-app/. The live site address is listed in Section 9. The URL and project context identify Vercel, but this document-generation run did not independently inspect the Vercel dashboard or verify current deployment status.

6. DATABASE STRUCTURE

The repository's Supabase SQL migrations define the tables below. These files show the intended schema; whether every migration has been applied to the remote database was not confirmed.

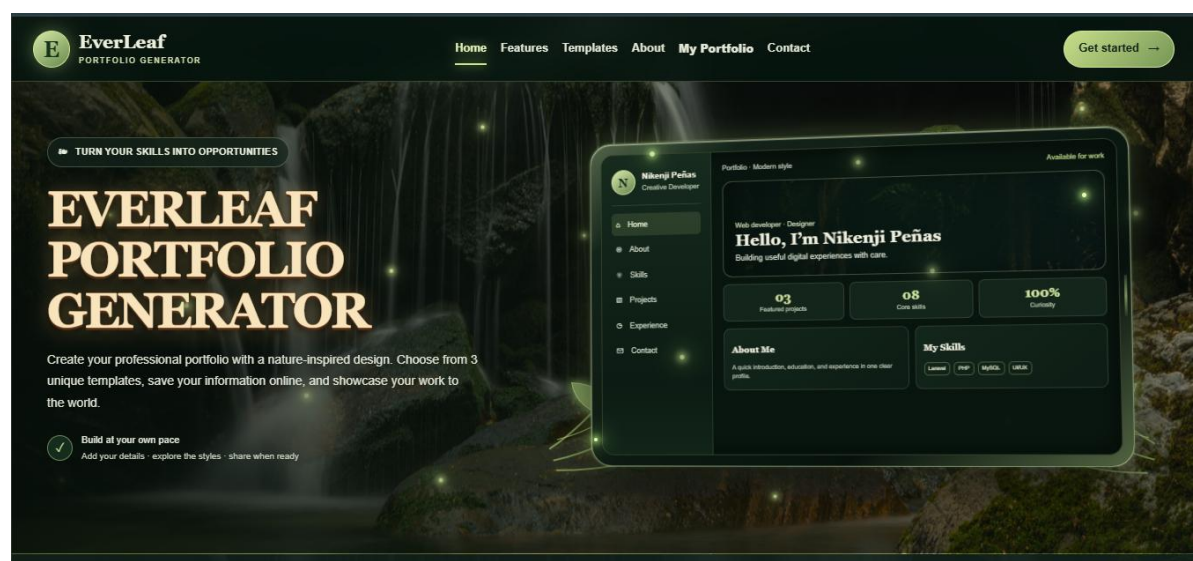

Table	Important columns	Keys and relationship
portfolios	id, user_id, slug, full_name, email, role, about_me, contact_number, address, template_key, profile_photo_path, skills (JSONB), projects (JSONB), is_published, deleted_at, created_at, updated_at	id is primary key; user_id references auth.users(id); slug is unique.
portfolio_education	id, portfolio_id, school, degree, field_of_study, start_date, end_date, currently_studying, description, sort_order, created_at	id is primary key; portfolio_id references portfolios(id) with cascade delete.
portfolio_experiences	id, portfolio_id, position, company, start_date, end_date, currently_working, description, sort_order, created_at	id is primary key; portfolio_id references portfolios(id) with cascade delete.
portfolio_social_links	id, portfolio_id, platform, url, sort_order, created_at	id is primary key; portfolio_id references portfolios(id) with cascade delete.

Each portfolio can have multiple education entries, work-experience entries, and social links. Skills and projects are JSONB fields on the portfolio row. The migrations define indexes and Row Level Security policies; their hosted deployment status remains unverified.

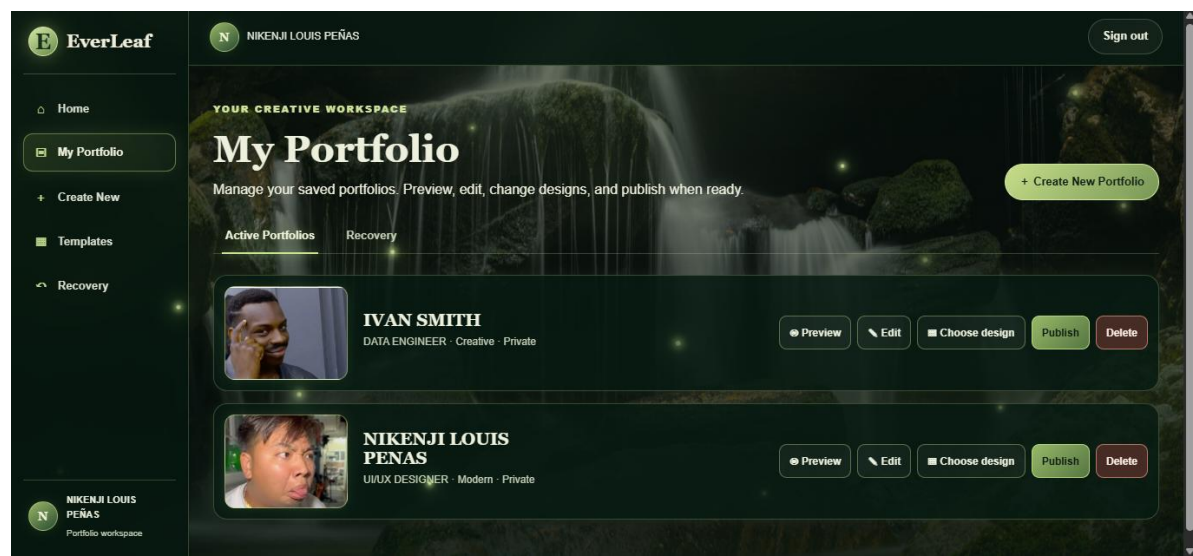

7. SCREENSHOTS OF THE SYSTEM

These genuine EverLeaf system screenshots are available in the project documentation folder. The existing collection does not include a login or registration screenshot.
